#### **BIOLOGICAL ACTIVITY**

Description

Sodium dodecyl sulfate is an anionic surfactant commonly used as a detergent, emulsifier, and protein denaturant in various industrial processes, especially in the production of personal care products, cleaners, and laboratory reagents. Sodium dodecyl sulfate has unique chemical properties that make it an effective ingredient in many applications, helping to reduce surface tension and enhance cleaning power.

In Vitro

Sodium dodecyl sulfate can be used as an excipient. Pharmaceutical excipients, or pharmaceutical auxiliaries, refer to other chemical substances used in the pharmaceutical process other than pharmaceutical ingredients. Pharmaceutical excipients generally refer to inactive ingredients in pharmaceutical preparations, which can improve the stability, solubility and processability of pharmaceutical preparations. Pharmaceutical excipients also affect the absorption, distribution, metabolism, and elimination (ADME) processes of co-administered drugs<sup>[1]</sup>.
