

ACHe/BACE1/GSK3β-IN-1

Cat. No.:	HY-151260
CAS No.:	2866066-81-9
Molecular Formula:	C ₂₆ H ₂₇ FN ₂ O ₄
Molecular Weight:	450.5
Target:	Beta-secretase; Cholinesterase (ChE); GSK-3
Pathway:	Neuronal Signaling; PI3K/Akt/mTOR; Stem Cell/Wnt
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY

Description	<p>ACHe/BACE1/GSK3β-IN-1 is an orally active triple inhibitor of AChE/BACE1/GSK3β. AChE/BACE1/GSK3β-IN-1 has effective inhibitory activity against AChE, BACE1 and GSK3β with IC₅₀ values of 1.0 μM, 20 μM and 15 μM, respectively.</p> <p>ACHe/BACE1/GSK3β-IN-1 has good blood-brain barrier penetrability, suitable bioavailability. AChE/BACE1/GSK3β-IN-1 can be used for the research of Alzheimer's disease (AD)^[1].</p>										
IC₅₀ & Target	<p>BACE1</p> <p>20 μM (IC₅₀)</p>	<p>AChE</p> <p>1 μM (IC₅₀)</p>	<p>GSK-3β</p> <p>15 μM (IC₅₀)</p>								
In Vitro	<p>ACHe/BACE1/GSK3β-IN-1 shows effective inhibition for AChE, BACE1 and GSK3β with IC₅₀ values of 1.0 μM, 20 μM and 15 μM, respectively^[1].</p> <p>ACHe/BACE1/GSK3β-IN-1 can pass through BBB^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>										
In Vivo	<p>ACHe/BACE1/GSK3β-IN-1 (oral, 200 and 400 mg/kg, single) shows no acute toxicity and good safety profile in C57B6/J Mice^[1].</p> <p>ACHe/BACE1/GSK3β-IN-1 (p.o., 100 mg/kg; i.v., 10 mg/kg) has good PK profiles^[1].</p> <p>ACHe/BACE1/GSK3β-IN-1 (gavage, 2.5 mg/kg, 5 mg/kg and 10mg/kg, for 7 consecutive days) can ameliorate the impaired learning and memory in Aβ-induced AD mice^[1].</p> <p>ACHe/BACE1/GSK3β-IN-1 inhibits the expression of ADAM17 in the cortex and significantly decreases the expressions of ADAM17 and BACE1 in AD mice^[1].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 30%;">Animal Model:</td> <td>C57B6/J Mice^[1]</td> </tr> <tr> <td>Dosage:</td> <td>200 and 400 mg/kg</td> </tr> <tr> <td>Administration:</td> <td>oral, single</td> </tr> <tr> <td>Result:</td> <td> <p>Increased slightly serum alanine aminotransferase (ALT) and aspartate aminotransferase (AST), but no significant difference.</p> <p>Showed no significant change in the content of blood urea nitrogen (BUN).</p> <p>Did not change significantly the morphology of liver and kidney tissue of mice.</p> </td> </tr> </table>			Animal Model:	C57B6/J Mice ^[1]	Dosage:	200 and 400 mg/kg	Administration:	oral, single	Result:	<p>Increased slightly serum alanine aminotransferase (ALT) and aspartate aminotransferase (AST), but no significant difference.</p> <p>Showed no significant change in the content of blood urea nitrogen (BUN).</p> <p>Did not change significantly the morphology of liver and kidney tissue of mice.</p>
Animal Model:	C57B6/J Mice ^[1]										
Dosage:	200 and 400 mg/kg										
Administration:	oral, single										
Result:	<p>Increased slightly serum alanine aminotransferase (ALT) and aspartate aminotransferase (AST), but no significant difference.</p> <p>Showed no significant change in the content of blood urea nitrogen (BUN).</p> <p>Did not change significantly the morphology of liver and kidney tissue of mice.</p>										

Animal Model:	male Sprague-Dawley (SD) rats ^[1]																															
Dosage:	10 mg/kg and 100 mg/kg																															
Administration:	oral and intravenous																															
Result:	<table border="1"> <thead> <tr> <th>parameters</th> <th>100 mg/kg (p.o.)</th> <th>10 mg/kg(i.v.)</th> </tr> </thead> <tbody> <tr> <td>C_{max}(ng/mL)</td> <td>167 ± 13</td> <td>2796 ± 259</td> </tr> <tr> <td>AUC_{0-t}(ng/mL)</td> <td>1010 ± 112</td> <td>1031 ± 86</td> </tr> <tr> <td>AUC_{0-∞}(ng/mL*h)</td> <td>1635 ± 362</td> <td>1047 ± 88</td> </tr> <tr> <td>t_{1/2} (h)</td> <td>20 ± 9</td> <td>0.4 ± 0.04</td> </tr> <tr> <td>Cl (L/h/kg)</td> <td>63 ± 12</td> <td>10 ± 1</td> </tr> <tr> <td>MRT_{0-∞}(h)</td> <td>26 ± 11</td> <td>0.3 ± 0</td> </tr> <tr> <td>V_Z(L/kg)</td> <td>1730 ± 387</td> <td>5 ± 1</td> </tr> <tr> <td>T_{max}(h)</td> <td>1</td> <td>0.08</td> </tr> <tr> <td>F (%)</td> <td>9.8</td> <td></td> </tr> </tbody> </table>		parameters	100 mg/kg (p.o.)	10 mg/kg(i.v.) Animal Model:	Aβ-induced AD mice ^[1]																															
Dosage:	2.5 mg/kg, 5 mg/kg and 10mg/kg																															
Administration:	gavage, for 7 consecutive days																															
Result:	Decreased the escape latency of mice. Increased the number of crossing platforms in mice in a dose-dependent trend.
