### BIOLOGICAL ACTIVITY

<b>Description</b>	Ladostigil (TV-3326) hemitartrate is an orally active dual inhibitor of cholinesterase and brain-selective monoamine oxidase (MAO), with IC <sub>50</sub> s of 37.1 and 31.8 μM for MAO-B and AChE, respectively. Ladostigil hemitartrate exhibits neuroprotective, antioxidant and anti-inflammatory activities. Ladostigil hemitartrate can be used for the research of depression and Alzheimer's disease <sup>[1][2]</sup> . Ladostigil (hemitartrate) is a click chemistry reagent, it contains an Alkyne group and can undergo copper-catalyzed azide-alkyne cycloaddition (CuAAC) with molecules containing Azide groups.	
<b>IC<sub>50</sub> &amp; Target</b>	MAO-B 37.1 nM (IC <sub>50</sub> )	AChE 31.8 nM (IC <sub>50</sub> )

<b>In Vitro</b>	Ladostigil (1-10 $\mu$ M) hemitartrate exerts neuroprotective activities, including a prevention of the fall of the mitochondrial membrane potential ( $\psi$ ), attenuation of apoptotic cascades and an inhibition of ROS production induced by OS insults <sup>[2]</sup> . Ladostigil (1-10 $\mu$ M) hemitartrate has a significant neuroprotective activity, including inhibition of caspase-3 activation, induction of Bcl-2 and reduction of Bad and Bax gene and protein expression in human neuroblastoma SK-N-SH cells <sup>[2]</sup> . MCE has not independently confirmed the accuracy of these methods. They are for reference only.								
<b>In Vivo</b>	<p>Ladostigil (17 mg/kg; p.o. daily for 6 weeks) hemitartrate abolishes their hyperanxiety and depressive-like behaviour in the elevated plus maze (EPM) and forced swim tests (FST) tests in adulthood from puberty to prenatally-stressed rats<sup>[4]</sup>. Ladostigil (50 <math>\mu</math>mol/kg; single p.o.) hemitartrate restores the loss of episodic memory in the object recognition test in rats<sup>[3]</sup>. MCE has not independently confirmed the accuracy of these methods.
