

Neocarzinostatin

Cat. No.:	HY-111183		
CAS No.:	9014-02-2		
Target:	DNA/RNA Synthesis; Apoptosis; Bacterial; Antibiotic		
Pathway:	Cell Cycle/DNA Damage; Apoptosis; Anti-infection		
Storage:	Pure form	-20°C	3 years
		4°C	2 years
	In solvent	-80°C	6 months
		-20°C	1 month

Neocarzinostatin

BIOLOGICAL ACTIVITY

Description	Neocarzinostatin, a potent DNA-damaging, anti-tumor antibiotic, recognizes double-stranded DNA bulge and induces DNA double strand breaks (DSBs). Neocarzinostatin induces apoptosis. Neocarzinostatin has potential for EpCAM-positive cancers treatment ^{[1][2]} .
In Vitro	<p>The EpCAM aptamer conjugated Neocarzinostatin (NCS) shows specificity to EpCAM-positive cells. The effects of the conjugates on cancer cells are impressive as the conjugate arrests the cell cycle and promoted apoptosis and necrosis. The high levels of PARP expression confirmed the DNA breaks upon conjugate treatment. NCS conjugated with EpCAM can be targeted to cancer cells sparing normal cells^[3].</p> <p>The IC₅₀ values of Neocarzinostatin (72 hours) to C6 cells and U87MG cells were 493.64 nM, 462.96 nM, respectively^[4].</p> <p>In human tumor cell lines of different tissue origins, sensitivity to neocarzinostatin is proportional to the product of the relative contents of Bcl-2 and caspase-3^[5].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
