

## PMX-53

<b>Cat. No.:</b>	HY-106178
<b>CAS No.:</b>	219639-75-5
<b>Molecular Formula:</b>	C <sub>47</sub> H <sub>65</sub> N <sub>11</sub> O <sub>7</sub>
<b>Molecular Weight:</b>	896.09
<b>Sequence Shortening:</b>	F-{Orn}-P-{d-Cha}-WR (Lactam bridge: Orn2- Arg6)
<b>Target:</b>	Complement System
<b>Pathway:</b>	Immunology/Inflammation
<b>Storage:</b>	Sealed storage, away from moisture and light, under nitrogen Powder    -80°C    2 years -20°C    1 year
	* In solvent : -80°C, 2 years; -20°C, 1 year (sealed storage, away from moisture and light, under nitrogen)

## SOLVENT & SOLUBILITY

### In Vitro

DMSO : 200 mg/mL (223.19 mM; Need ultrasonic)  
H<sub>2</sub>O : 2.5 mg/mL (2.79 mM; ultrasonic and warming and heat to 60°C)

Preparing Stock Solutions	Solvent Concentration	Mass		
		1 mg	5 mg	10 mg
	1 mM	1.1160 mL	5.5798 mL	11.1596 mL
	5 mM	0.2232 mL	1.1160 mL	2.2319 mL
	10 mM	0.1116 mL	0.5580 mL	1.1160 mL

Please refer to the solubility information to select the appropriate solvent.

### In Vivo

- Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline  
Solubility: ≥ 2.08 mg/mL (2.32 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)  
Solubility: ≥ 2.08 mg/mL (2.32 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% corn oil  
Solubility: ≥ 2.08 mg/mL (2.32 mM); Clear solution

## BIOLOGICAL ACTIVITY

### Description

PMX-53 (3D53) is a synthetic peptidic and a potent and orally active complement C5a receptor (CD88) antagonist with an IC<sub>50</sub> of 20 nM. PMX-53 is also a low-affinity MrgX2 agonist that stimulates MrgX2-mediated mast cell degranulation. PMX-53 specifically binds to C5aR1 and does not bind to the second C5aR (C5L2) and C3aR. PMX-53 has anti-inflammatory, anticancer and antiatherosclerotic effects<sup>[1][2][3][4][5][6]</sup>.

<b>IC<sub>50</sub> &amp; Target</b>	IC <sub>50</sub> : 20 nM (Complement C5a receptor) <sup>[4]</sup> MrgX2 <sup>[1]</sup>								
<b>In Vitro</b>	<p>PMX-53 is a potent CD88 antagonist and inhibits C5a-induced neutrophil myeloperoxidase release and chemotaxis with IC<sub>50</sub> values of 22 nM and 75 nM, respectively<sup>[1]</sup>.</p> <p>PMX-53 (10 nM) inhibits C5a-induced Ca<sup>2+</sup> mobilization in HMC-1 cells, but at higher concentrations (≥30 nM) it causes degranulation in LAD2 mast cells, CD34<sup>+</sup> cell-derived mast cells, and RBL-2H3 cells stably expressing MrgX2. Replacement of Trp with Ala and Arg with dArg abolishes the ability of PMX-53 to inhibit C5a-induced Ca<sup>2+</sup> mobilization in HMC-1 cells and to cause degranulation in RBL-2H3 cells expressing MrgX2<sup>[1]</sup>.</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>								
<b>In Vivo</b>	<p>PMX-53 (0.3-3 mg/kg; subcutaneous injection; once; male Wistar rats) treatment inhibits the hypernociception induced by zymosan-activated serum and C5a but not by the direct-acting hypernociceptive mediators, prostaglandin E2 and dopamine<sup>[2]</sup>.</p> <p>Local pretreatment of rats with PMX-53 (60-180 μg per paw) inhibits zymosan-, carrageenan-, lipopolysaccharide (LPS)- and antigen-induced hypernociception<sup>[2]</sup>.</p> <p>Pharmacokinetic analyses have shown that PMX-53 (3D53) appears in the plasma within 5 min of oral administration (3 mg/kg) to rats, with peak blood levels of approximately 0.3 μM being reached within 20 min. The plasma elimination half-life was approximately 70 min in this case<sup>[3]</sup>.</p> <p>The non-acetylated version of PMX-53 (3D53) binds to isolated mouse neutrophils with a K<sub>d</sub> value of 30 nM (mouse C5a binds with a K<sub>d</sub> value of 0.3 nM) and inhibits mouse C5a-induced chemotaxis with an IC<sub>50</sub> value of 0.5 nM<sup>[3]</sup>.</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <table border="1"> <tr> <td>Animal Model:</td> <td>Adult male Wistar rats (weighing 180-200 g) injected with zymosan<sup>[2]</sup></td> </tr> <tr> <td>Dosage:</td> <td>0.3 mg/kg, 1 mg/kg or 3 mg/kg</td> </tr> <tr> <td>Administration:</td> <td>Subcutaneous injection; once</td> </tr> <tr> <td>Result:</td> <td>Inhibited the hypernociception induced by zymosan-activated serum and C5a.</td> </tr> </table>	Animal Model:	Adult male Wistar rats (weighing 180-200 g) injected with zymosan <sup>[2]</sup>	Dosage:	0.3 mg/kg, 1 mg/kg or 3 mg/kg	Administration:	Subcutaneous injection; once	Result:	Inhibited the hypernociception induced by zymosan-activated serum and C5a.
Animal Model:	Adult male Wistar rats (weighing 180-200 g) injected with zymosan <sup>[2]</sup>								
Dosage:	0.3 mg/kg, 1 mg/kg or 3 mg/kg								
Administration:	Subcutaneous injection; once								
Result:	Inhibited the hypernociception induced by zymosan-activated serum and C5a.
