

Zolunicant

Cat. No.:	HY-147428	
CAS No.:	188125-42-0	
Molecular Formula:	C ₂₂ H ₂₈ N ₂ O ₃	
Molecular Weight:	368.47	
Target:	nAChR; Parasite	
Pathway:	Membrane Transporter/Ion Channel; Neuronal Signaling; Anti-infection	
Storage:	Powder	-20°C 3 years
	In solvent	-80°C 6 months
		-20°C 1 month

BIOLOGICAL ACTIVITY

Description	Zolunicant (MM-110) is a potent inhibitor against nicotinic $\alpha 3\beta 4$ receptors with an IC ₅₀ of 0.90 μ M to combat addiction. Zolunicant can decrease the self-administration of several addictive agents including morphine, methamphetamine, nicotine, and ethanol in rat model. Zolunicant can be studied as a potential research for multiple forms of agent abuse ^[1] . Zolunicant also reveals a potent leishmanicide effect against <i>Leishmania amazonensis</i> ^[2] .								
IC₅₀ & Target	Leishmania								
In Vitro	<p>Zolunicant (18-MC; 0.01-100 μM) shows an inhibitory activity against nicotinic $\alpha 3\beta 4$ receptors with an IC₅₀ of 0.90 μM^[1]. Zolunicant (18-MCOR; 0-20 μg/ml; 24h) also shows anti-amastigote activity against <i>L. amazonensis</i>-infected macrophage^[2]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <p>Cell Viability Assay^[2]</p> <table border="1"> <tr> <td>Cell Line:</td> <td>L. amazonensis-infected macrophage</td> </tr> <tr> <td>Concentration:</td> <td>0, 1, 10, 15 and 20 μg/ml</td> </tr> <tr> <td>Incubation Time:</td> <td>24 h</td> </tr> <tr> <td>Result:</td> <td>Decreased the amastigote survival by 73, 84, and 92%, respectively in the treatment with 18-MCOR at 1, 10, or 20 μg/ml.</td> </tr> </table>	Cell Line:	L. amazonensis-infected macrophage	Concentration:	0, 1, 10, 15 and 20 μ g/ml	Incubation Time:	24 h	Result:	Decreased the amastigote survival by 73, 84, and 92%, respectively in the treatment with 18-MCOR at 1, 10, or 20 μ g/ml.
Cell Line:	L. amazonensis-infected macrophage								
Concentration:	0, 1, 10, 15 and 20 μ g/ml								
Incubation Time:	24 h								
Result:	Decreased the amastigote survival by 73, 84, and 92%, respectively in the treatment with 18-MCOR at 1, 10, or 20 μ g/ml.								
In Vivo	<p>Zolunicant (18-MC; Intravenous administration; 0-20 μg a day; 14 days) decreases morphine self-administration by blocking $\alpha 3\beta 4$ nicotinic receptors in the habenulo-interpeduncular pathway^[3]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <table border="1"> <tr> <td>Animal Model:</td> <td>Naïve female Long-Evans derived rats^[3]</td> </tr> <tr> <td>Dosage:</td> <td>0, 10 and 20 μg</td> </tr> <tr> <td>Administration:</td> <td>Intravenous administration; once a day; 14 days</td> </tr> <tr> <td>Result:</td> <td>Infused into the medial habenula and interpeduncular nucleus decreased morphine self-</td> </tr> </table>	Animal Model:	Naïve female Long-Evans derived rats ^[3]	Dosage:	0, 10 and 20 μ g	Administration:	Intravenous administration; once a day; 14 days	Result:	Infused into the medial habenula and interpeduncular nucleus decreased morphine self-
Animal Model:	Naïve female Long-Evans derived rats ^[3]								
Dosage:	0, 10 and 20 μ g								
Administration:	Intravenous administration; once a day; 14 days								
Result:	Infused into the medial habenula and interpeduncular nucleus decreased morphine self-								

administration (interpeduncular nucleus: $F(5,29) = 6.89, P < 0.0001$; medial habenula: $F(4,28) = 3.07, P < 0.03$).
