

β-Spaglamic acid

Cat. No.:	HY-130553
CAS No.:	4910-46-7
Molecular Formula:	C ₁₁ H ₁₆ N ₂ O ₈
Molecular Weight:	304.25
Target:	Aminopeptidase; mGluR
Pathway:	Metabolic Enzyme/Protease; GPCR/G Protein; Neuronal Signaling
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

BIOLOGICAL ACTIVITY

Description	β-Spaglamic acid (β-NAAG) is a competitive NAAG peptidase inhibitor ($K_i=1 \mu\text{M}$) that protects spinal cord neurons from excitotoxicity and hypoxic damage. β-Spaglamic acid is also a selective mGluR3 antagonist (mGluR3 receptor functions to regulate activity-dependent synaptic potentiation in the hippocampus). β-Spaglamic acid can be used in neuroprotection-related studies ^{[1][2]} .												
IC₅₀ & Target	NAAG peptidase, mGluR3 ^{[1][2]} .												
In Vitro	<p>β-Spaglamic acid (63-1000 μM; 2 h) protects against NMDA-induced injury of spinal cord cells in a dose-dependent manner^[1].</p> <p>β-Spaglamic acid (0-1000 μM; 2 h) protects spinal cord cells against hypoxia^[1].</p> <p>β-Spaglamic acid (500 μM) significantly reduces intraneuronal free Ca²⁺ responses upon neuronal exposure to 25 μM NMDA^[1].</p> <p>β-Spaglamic acid (100 μM; 7 min) antagonizes mGluR3 in cerebellar granule cells^[2].</p> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <p>Cell Viability Assay^[1]</p> <table border="1"> <tr> <td>Cell Line:</td> <td>Spinal cord cells (NMDA-induced) (from spinal cords removed from prenatal day 15 Sprague-Dawley rat fetuses)</td> </tr> <tr> <td>Concentration:</td> <td>63-1000 μM</td> </tr> <tr> <td>Incubation Time:</td> <td>2 h</td> </tr> <tr> <td>Result:</td> <td>Led to a significant attenuation of NMDA toxicity at a concentration of 63 μM and completely blocked NMDA toxicity with 500 and 1000 μM concentrations. Apparently minimized the basal loss of cell viability associated with experimental handling of the cells (e.g. serum removal, media changes).</td> </tr> </table> <p>Cell Viability Assay^[1]</p> <table border="1"> <tr> <td>Cell Line:</td> <td>Spinal cord cells (hypoxic-induced)</td> </tr> <tr> <td>Concentration:</td> <td>0-1000 μM</td> </tr> </table>	Cell Line:	Spinal cord cells (NMDA-induced) (from spinal cords removed from prenatal day 15 Sprague-Dawley rat fetuses)	Concentration:	63-1000 μM	Incubation Time:	2 h	Result:	Led to a significant attenuation of NMDA toxicity at a concentration of 63 μM and completely blocked NMDA toxicity with 500 and 1000 μM concentrations. Apparently minimized the basal loss of cell viability associated with experimental handling of the cells (e.g. serum removal, media changes).	Cell Line:	Spinal cord cells (hypoxic-induced)	Concentration:	0-1000 μM
Cell Line:	Spinal cord cells (NMDA-induced) (from spinal cords removed from prenatal day 15 Sprague-Dawley rat fetuses)												
Concentration:	63-1000 μM												
Incubation Time:	2 h												
Result:	Led to a significant attenuation of NMDA toxicity at a concentration of 63 μM and completely blocked NMDA toxicity with 500 and 1000 μM concentrations. Apparently minimized the basal loss of cell viability associated with experimental handling of the cells (e.g. serum removal, media changes).												
Cell Line:	Spinal cord cells (hypoxic-induced)												
Concentration:	0-1000 μM												

Incubation Time:	2 h
Result:	Provided 75% protection during hypoxia when at 8 μ M and completely eliminated hypoxia-induced loss of viability (107.4-114.4% protection, respectively) when at 63-1000 μ M.
Cell Viability Assay ^[2]	
Cell Line:	Cerebellar granule cells (expressing group I-III mGluRs)
Concentration:	100 μ M
Incubation Time:	7 min
Result:	Blocked NAAG inhibition of forskolin-stimulated cAMP formation via mGluR3.
