

Idasanutlin

Cat. No.:	HY-15676		
CAS No.:	1229705-06-9		
Molecular Formula:	C ₃₁ H ₂₉ Cl ₂ F ₂ N ₃ O ₄		
Molecular Weight:	616.48		
Target:	MDM-2/p53; E1/E2/E3 Enzyme		
Pathway:	Apoptosis; Metabolic Enzyme/Protease		
Storage:	Powder	-20°C	3 years
		4°C	2 years
	In solvent	-80°C	1 year
		-20°C	6 months

SOLVENT & SOLUBILITY

In Vitro

DMSO : ≥ 45 mg/mL (73.00 mM)
 * "≥" means soluble, but saturation unknown.

Preparing Stock Solutions	Solvent Concentration	Mass		
		1 mg	5 mg	10 mg
	1 mM	1.6221 mL	8.1106 mL	16.2211 mL
	5 mM	0.3244 mL	1.6221 mL	3.2442 mL
	10 mM	0.1622 mL	0.8111 mL	1.6221 mL

Please refer to the solubility information to select the appropriate solvent.

In Vivo

- Add each solvent one by one: 0.5%HPMC >> 1%Tween80
 Solubility: 10 mg/mL (16.22 mM); Suspended solution; Need ultrasonic
- Add each solvent one by one: 10% DMSO >> 90% corn oil
 Solubility: ≥ 2.5 mg/mL (4.06 mM); Clear solution

BIOLOGICAL ACTIVITY

Description

Idasanutlin (RG7388) is a potent and selective MDM2 antagonist, inhibiting p53-MDM2 binding, with an IC₅₀ of 6 nM.

IC₅₀ & Target

IC₅₀: 6 nM (p53-MDM2)^[1]

In Vitro

Idasanutlin (RG7388) inhibits cell proliferation with IC₅₀ of 30 nM, and induces dose-dependent p53 stabilization, cell cycle arrest, as well as cell apoptosis in cancer cells expressing wild-type p53^[1].
 Idasanutlin (RG7388) (300 nM or 1.8 μM) induces apoptosis in SJSA osteosarcoma cells^[2].
 MCE has not independently confirmed the accuracy of these methods. They are for reference only.

In Vivo

Idasanutlin (RG7388, 25 mg/kg p.o.) results in tumor growth inhibition and regression, in the mouse SJSA human osteosarcoma xenograft model^[1].

Idasanutlin (RG7388) induces induction of apoptosis and antiproliferation, in the SJSA xenograft model^[2].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

PROTOCOL

Cell Assay ^[1]

Cell proliferation is evaluated by the tetrazolium dye assay. The concentration at which 50% inhibition (IC₅₀) or 90% inhibition (IC₉₀) of cell proliferation is determined from the linear regression of a plot of the logarithm of the concentration versus percent inhibition.

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

Animal Administration ^[2]

At 10 to 12 weeks of age, mice are implanted with a 1:1 mixture of human SJSA osteosarcoma cells (ATCC) suspended in phenol-free Matrigel and PBS. Mice are implanted in the right flank at a concentration of 5×10^6 cells in 0.2 mL total volume. At approximately day 10, animals are randomized according to tumor volume, so that all groups of 10 randomized mice have similar starting mean tumor volumes of 100 to 250 mm³. Idasanutlin (RG7388) is administered as an amorphous solid dispersion microbulk precipitate powder containing 30% drug substance and 70% hydroxypropyl methylcellulose acetate succinate polymer that is reconstituted immediately before administration as a suspension in Klucel/Tween, and remaining suspension is discarded after dosing.

MCE has not independently confirmed the accuracy of these methods. They are for reference only.
