Acetylcysteine

Cat. No.:	HY-B0215
CAS No.:	616-91-1
Molecular Formula:	$C_5H_9NO_3S$
Molecular Weight:	163.19
Target:	Reactive Oxygen Species; Endogenous Metabolite; Apoptosis; Ferroptosis; Influenza Virus
Pathway:	Immunology/Inflammation; Metabolic Enzyme/Protease; NF-κB; Apoptosis; Anti-infection
Storage:	4°C, protect from light
	* In solvent : -80°C, 6 months; -20°C, 1 month (protect from light)
SOLVENT & SOLUBILITY

In Vitro	H_2O : 100 mg/mL (612.76 mM; Need ultrasonic)

Preparing Stock Solutions	Solvent Mass / Concentration	1 mg	5 mg	10 mg
	1 mM	6.1276 mL	30.6382 mL	61.2764 mL
	5 mM	1.2255 mL	6.1276 mL	12.2553 mL
	10 mM	0.6128 mL	3.0638 mL	6.1276 mL

Please refer to the solubility information to select the appropriate solvent.

In Vivo	1. Add each solvent one by one: PBS Solubility: 120 mg/mL (735.32 mM); Clear solution; Need ultrasonic

BIOLOGICAL ACTIVITY

Description	Acetylcysteine (N-Acetylcysteine) is a mucolytic agent which reduces the thickness of the mucus. Acetylcysteine is a ROS inhibitor[1]. Acetylcysteine is a cysteine precursor, prevents hemin-induced ferroptosis by neutralizing toxic lipids generated by arachidonate-dependent activity of 5-lipoxygenases[5]. Acetylcysteine induces cell apoptosis[2][3]. Acetylcysteine also has anti-influenza virus activities[7].
IC$_{50}$ & Target	Human Endogenous Metabolite
In Vitro	Acetylcysteine prevents apoptotic DNA fragmentation and maintains long-term survival in the absence of other trophic support in serum-deprived PC12 cells. Acetylcysteine also prevents death of PC12 cells and sympathetic neurons[2]. Acetylcysteine causes dose-dependent reductions in viability in rat and human aortic smooth muscle cells[3]. Acetylcysteine activates the Ras-extracellular signal-regulated kinase (ERK) pathway in PC12 cells. Acetylcysteine protects neuronal cells from death evoked by withdrawal of trophic support. Acetylcysteine increases nitric oxide (NO) release from

	protein-bound stores in vascular tissue. Acetylcysteine pretreatment of PC12 cells interferes with NGF-dependent signaling and neurite outgrowth, and it is suggested that Acetylcysteine interferes with redox-sensitive steps in the NGF mechanism[4]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
In Vivo	Acetylcysteine (150, 300 mg/kg) treatment significantly reduces liver transaminases in all groups of treatment, mostly in group Acetylcysteine 300 mg/kg. Lung glutathione peroxidase is significantly increases in group Acetylcysteine 300 mg/kg($P=0.04$), while the other oxidation biomarkers show no significant differences[6]. Acetylcysteine improves cognition of 12-month-old SAMP8 mice in both the T-maze footshock avoidance paradigm and the lever press appetitive task without inducing non-specific effects on motor activity, motivation to avoid shock, or body weight[5]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.

PROTOCOL

Cell Assay [2]	For survival experiments, washed cells are resuspended in RPM1 1640 medium and plated in 0.5 mL at a density of 8-10×10^5 per well in 24 well plastic culture dishes coated with rat tail collagen. To feed, but to avoid loss of floating cells, fresh medium (0.2 mL) is added to the cultures on days 1, 5, and 10. For experiments involving "primed" PC12 cells, cultures are pretreated for l-2 weeks with NGF in RPM1 1640 medium supplemented with 1% heat-iN-acetylcysteinetivated horse serum. The cells are then washed and passaged into serum-free RPM1 1640 medium. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
Animal Administration [6]	Rats: Rats are randomLy allocated into five groups: sham group (n=5), control group with IIR (n=8) and three groups with IIR who are given Acetylcysteine in different dosages: 150 mg/kg intraperitoneally 5 min before ischemia (n=8, group Acetylcysteine 150), 300 mg/kg i.p 5 min before ischemia (n=7, group Acetylcysteine 300), and 150 mg/kg i.p 5 min before ischemia plus 150 mg/kg 5 min before reperfusion (n=7, group Acetylcysteine 150 + 150). After 4 h of reperfusion, the animals are euthanized by exsanguination from the abdominal aorta. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
