

Proglumide

Cat. No.:	HY-B1330		
CAS No.:	6620-60-6		
Molecular Formula:	C ₁₈ H ₂₆ N ₂ O ₄		
Molecular Weight:	334.41		
Target:	Cholecystokinin Receptor		
Pathway:	GPCR/G Protein; Neuronal Signaling		
Storage:	Powder	-20°C	3 years
		4°C	2 years
	In solvent	-80°C	2 years
		-20°C	1 year

SOLVENT & SOLUBILITY

In Vitro

DMSO : ≥ 65 mg/mL (194.37 mM)
 * "≥" means soluble, but saturation unknown.

Preparing Stock Solutions	Solvent Concentration	Mass		
		1 mg	5 mg	10 mg
	1 mM	2.9903 mL	14.9517 mL	29.9034 mL
	5 mM	0.5981 mL	2.9903 mL	5.9807 mL
	10 mM	0.2990 mL	1.4952 mL	2.9903 mL

Please refer to the solubility information to select the appropriate solvent.

In Vivo

- Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline
Solubility: ≥ 2.17 mg/mL (6.49 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% (20% SBE-β-CD in saline)
Solubility: ≥ 2.17 mg/mL (6.49 mM); Clear solution
- Add each solvent one by one: 10% DMSO >> 90% corn oil
Solubility: ≥ 2.17 mg/mL (6.49 mM); Clear solution

BIOLOGICAL ACTIVITY

Description

Proglumide is a nonpeptide and orally active cholecystokinin (CCK)-A/B receptors antagonist. Proglumide selective blocks CCK's effects in the central nervous system (CNS). Proglumide has ability to inhibit gastric secretion and to protect the gastroduodenal mucosa. Proglumide also has antiepileptic and antioxidant activities^{[1][2][3][4][5]}.

IC₅₀ & Target

Cholecystokinin (CCK)-A/B receptors^{[1][2]}

<p>In Vitro</p>	<p>In an in vitro study, Proglumide at concentrations between 0.3-10 mM inhibits CCK-stimulated amylase release dose-dependently, while Proglumide does not influence the basal amylase release at concentrations between 0-3 mM. Dose-response curves to CCK for amylase release shifted to the right with increase in Proglumide concentration. This inhibition by Proglumide is reversible. In addition, the effect of Proglumide is selective for CCK and its related peptide^[2]. The incubation of HT29 cells with Proglumide significantly reduces the [³H]-thymidine incorporation to HT29 cells in a dose-dependent manner, with an IC₅₀ of 6.5 mM. Proglumide reduces in a dose-dependent manner the percentage of necrosis with a parallel increase of apoptosis up to 70%^[3]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>								
<p>In Vivo</p>	<p>Proglumide (250-750 mg/kg; intraperitoneal injection; adult male Sprague Dawley rats) treatment is significantly effective in ameliorating the seizure activities, cognitive dysfunctions, and cerebral oxidative stress^[1]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p> <table border="1" data-bbox="345 552 1515 926"> <tr> <td data-bbox="345 552 618 646"> <p>Animal Model:</p> </td> <td data-bbox="618 552 1515 646"> <p>Adult male Sprague Dawley rats (200-250 g; 2 months old) are induced status epilepticus (SE)^[1]</p> </td> </tr> <tr> <td data-bbox="345 646 618 709"> <p>Dosage:</p> </td> <td data-bbox="618 646 1515 709"> <p>250 mg/kg, 500 mg/kg, and 750 mg/kg</p> </td> </tr> <tr> <td data-bbox="345 709 618 772"> <p>Administration:</p> </td> <td data-bbox="618 709 1515 772"> <p>Intraperitoneal injection</p> </td> </tr> <tr> <td data-bbox="345 772 618 926"> <p>Result:</p> </td> <td data-bbox="618 772 1515 926"> <p>Dose-dependently and significantly increased the latencies to seizure and SE.
